

DOUBLE SECURITY "IVF WITNESS" SYSTEM

Which guarantees maximum security in your Assisted Reproduction treatment

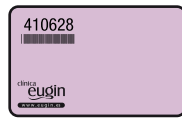

A personal card is assigned to each patient, which will record all the information throughout the process. These cards will be stored in a central server.

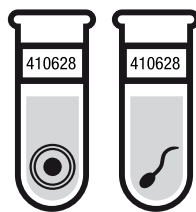

1

Reception

Each and every patient receives a unique personal code.

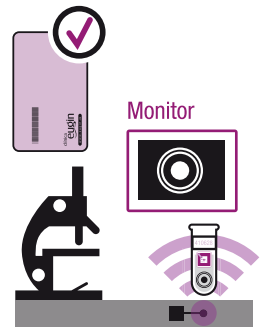

From now on, a microchip will also be attached containing the patient's details.

Control of the samples

The samples are identified using a bar code with the unique code of each patient.

2

In the laboratory, wireless receptors automatically check the identity of the sample.

Insemination

The identity of the samples is checked and validated before proceeding to insemination.

3

Implantation

All identities will be checked before the transfer.

4

The couple will also check that the sample is the correct one before implantation takes place.

In the unlikely case of there being an error, the system would detain the process.

The samples that are not transferred are frozen and kept identified at all times.

The triple supervision of specialists plus the use of the IVF Witness microchips provides total security.

THIS NEW SECURITY SYSTEM REINFORCES A PROCESS THAT WAS ALREADY EXTREMELY SAFE
